Important News

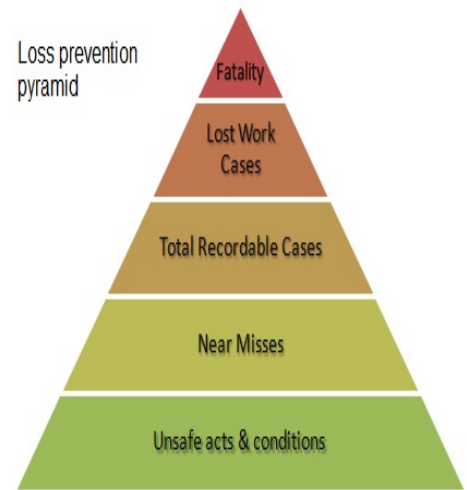

PDO aims to maintain a safe and healthy working environment by correcting situations that caused or could likely cause injury or damage. When an incident occurs, it is important to report the occurrence so corrective actions could be taken to make sure that a similar or more serious incidents do not re-occur. An incident is defined as “an unplanned and undesired event or chain of events that have, or could have, resulted in injury or illness, damage to assets, environment, company reputation, and/or consequential business loss”. There are different types of reportable incidents:

What You Need to Know

- Unsafe acts/conditions, including Life-Saving Rule violations
- Near misses

Normally, staff are good in reporting incidents with consequences. However, reporting near miss incidents is as important as reporting incidents with consequences. Near miss incidents are gifts that enable us to learn and rectify the situation before it escalates to injuries or damages.

A near miss incident is an unplanned event that did not result in an injury, illness, or damage to assets, environment or Company reputation, but had the potential to do so if some circumstance of the event were different. Only a fortunate break in the chain of events prevented an injury, fatality or damage; in other words, a miss that was nonetheless very near. There are different examples of what could be considered as a near miss:

- Someone trips on uneven pavement while walking. Being agile and empty handed, that person regains balance with no harm done.
- You stumble because of an uncorrected hole outside of a building but you don't fall.
- A projectile hits your safety glasses but does not injure your eye.
- An object falls near you and did not hit you.

There are other examples related to process safety near miss incidents such as:

- Mechanical seal leaks
- Momentarily the AP, LP and HP control valve failed due to mechanical “valve failure” or instrument component failure.
- Failure of the Blanketing gas control valve in fix roof tanks, resulting in blow by at valve
